Dialyzer User’s Guide

Dialyzer is a static analysis tool that identifies software discrepancies such as type errors, unreachable code, unnecessary tests, etc in single Erlang modules or entire (sets of) applications.

1.1 Dialyzer

1.1.1 Introduction

Dialyzer is a static analysis tool that identifies software discrepancies such as type errors, unreachable code, unnecessary tests, etc in single Erlang modules or entire (sets of) applications.

1.1.2 Using the Dialyzer from the GUI

Choosing the applications or modules

In the “File” window you will find a listing of the current directory. Click your way to the directories/modules you want to add or type the correct path in the entry.

Mark the directories/modules you want to analyze for discrepancies and click “Add”. You can either add the .beam and .erl-files directly, or you can add directories that contain these kinds of files. Note that you are only allowed to add the type of files that can be analyzed in the current mode of operation (see below), and that you cannot mix .beam and .erl-files.

The analysis modes

Dialyzer has two modes of analysis, “Byte Code” or “Source Code”. These are controlled by the buttons in the top-middle part of the main window, under “Analysis Options”.

Dialyzer Application (DIALYZER)
Chapter 1: Dialyzer User's Guide

Controlling the discrepancies reported by the Dialyzer

Under the “Warnings” pull-down menu, there are buttons that control which discrepancies are reported to the user in the “Warnings” window. By clicking on these buttons, one can enable/disable a whole class of warnings. Information about the classes of warnings can be found on the “Warnings” item under the “Help” menu (at the rightmost top corner).

If modules are compiled with inlining, spurious warnings may be emitted. In the “Options” menu you can choose to ignore inline-compiled modules when analyzing byte code. When starting from source code this is not a problem since the inlining is explicitly turned off by Dialyzer. The option causes Dialyzer to suppress all warnings from inline-compiled modules, since there is currently no way for Dialyzer to find what parts of the code have been produced by inlining.

Running the analysis

Once you have chosen the modules or directories you want to analyze, click the “Run” button to start the analysis. If for some reason you want to stop the analysis while it is running, push the “Stop” button.

The information from the analysis will be displayed in the Log and the Warnings windows.

Include directories and macro definitions

When analyzing from source you might have to supply Dialyzer with a list of include directories and macro definitions (as you can do with the erlc flags -I and -D). This can be done either by starting Dialyzer with these flags from the command line as in:

```
./dialyzer -I my_includes -DDEBUG -Dvsn=42 -I one_more_dir
```

or by adding these explicitly using the “Manage Macro Definitions” or “Manage Include Directories” sub-menus in the “Options” menu.

Saving the information on the Log and Warnings windows

In the “File” menu there are options to save the contents of the Log and the Warnings window. Just choose the options and enter the file to save the contents in.

There are also buttons to clear the contents of each window.

Inspecting the inferred types of the analyzed functions

Dialyzer stores the information of the analyzed functions in a Persistent Lookup Table (PLT). After an analysis you can inspect this information. In the PLT menu you can choose to either search the PLT or inspect the contents of the whole PLT. The information is presented in edoc format.

1.1.3 Using the Dialyzer from the command line

See dialyzer(3) [page 6].

1.1.4 Using the Dialyzer from Erlang

See dialyzer(3) [page 6].
1.1.5 More on the Persistent Lookup Table (PLT)

During setup, a Persistent Lookup Table will automatically be created for the Erlang/OTP libraries specified in dialyzer/src/Makefile. This table will be the starting point for later analyses. At each startup of Dialyzer the validity of the PLT will be checked, and if something has changed in the included libraries a new PLT will be constructed.

To build a PLT of your own favorite files use the \textit{--output.plt} option to specify where the file containing the PLT should be stored. At later analyses this PLT can be used as the starting point by using the \textit{--plt} option. Note that the new PLT file also includes the information from the PLT that was used as the starting point.

In an Erlang/OTP system which has been installed, the user typically does not have write permission to the file of the PLT. If Dialyzer later finds that the PLT is not up-to-date, the analysis is aborted with a warning. Until the installed PLT has been updated a temporary PLT can be created and used in the manner described above. For administrators that do have write permissions to the install directory, a new plt can be built by using the \textit{--checkinit.plt} option.

1.1.6 Feedback and bug reports

At this point, we very much welcome user feedback (even wish-lists!). If you notice something weird, especially if the Dialyzer reports any discrepancy that is a false positive, please send an error report describing the symptoms and how to reproduce them to:

\texttt{tobias.lindahl@it.uu.se, kostis@it.uu.se}
Dialyzer Reference Manual

Short Summaries

- Erlang Module dialyzer [page 6] - The Dialyzer, a Disclosure AnalyZer for ERlang programs

```
dialyzer
```

The following functions are exported:

- `gui() -> ok | {error, Msg}`  
  [page 8] Dialyzer GUI version
- `gui(OptList) -> ok | {error, Msg}`  
  [page 8] Dialyzer GUI version
- `run(OptList) -> {ok, Warnings, Errors} | {ok, Warnings} | {error, Message}`  
  [page 8] Dialyzer command line version
- `format_warning(Msg) -> string()`  
  [page 9] Get the string version of a warning message.
The Dialyzer is a static analysis tool that identifies software discrepancies such as type errors, unreachable code, unnecessary tests, etc. in single Erlang modules or entire (sets of) applications. Dialyzer starts its analysis from either debug-compiled BEAM bytecode or from Erlang source code. The file and line number of a discrepancy is reported along with an indication of what the discrepancy is about. Dialyzer bases its analysis on the concept of success typings which allows for sound warnings (no false positives).

Read more about Dialyzer and about how to use it from the GUI in Dialyzer User's Guide [page 1].

Using the Dialyzer from the command line

Dialyzer also has a command line version for automated use. Below is a brief description of the list of its options. The same information can be obtained by writing

dialyzer --help

in a shell. Please refer to the GUI description for more details on the operation of Dialyzer.

The exit status of the command line version is:

```
  0 - No problems were encountered during the analysis and no warnings were emitted.
  1 - Problems were encountered during the analysis.
  2 - No problems were encountered, but warnings were emitted.
```

Usage:

```
       [-pa dir]* [-plt plt] [-Ddefine]* [-I include_dir]*
       [--output_plt file] [-Wwarn]* [--src]
       [-c applications] [-r applications] [-o outfile]
```

Options:

```
-c applications (or --command-line applications) use Dialyzer from the command line (no GUI) to detect defects in the specified applications (directories or .erl or .beam files)
-r applications same as -c only that directories are searched recursively for subdirectories containing .erl or .beam files (depending on the type of analysis)
-o outfile (or --output outfile) when using Dialyzer from the command line, send the analysis results in the specified outfile rather than in stdout
--src override the default, which is to analyze debug compiled BEAM bytecode, and analyze starting from Erlang source code instead
```
-D name (or -D name=value) when analyzing from source, pass the define to Dialyzer (**)
- I include dir when analyzing from source, pass the include dir to Dialyzer (**)
- pa dir Include dir in the path for Erlang. Useful when analyzing files that have
  -include_lib() directives
--output plt file Store the plt at the specified location after building it.
--no_warn_on_inline Suppress warnings when analyzing an inline compiled bytecode
  file.
-plt plt Use the specified plt as the initial plt. If the plt was built during setup the
  files will be checked for consistency.
-W warn a family of option which selectively turn on/off warnings. (for help on the
  names of warnings use dialyzer -W help)
--check_init_plt Only checks if the init plt is up to date. For installed systems this
  also forces the rebuilding of the plt if this is not the case.
--shell do not disable the Erlang shell while running the GUI
--version (or -v) prints the Dialyzer version and some more information and exits
--help (or -h) prints this message and exits
--quiet (or -q) makes Dialyzer a bit more quiet
--verbose makes Dialyzer a bit more verbose

**Note**: 
* denotes that multiple occurrences of these options are possible.
** options -D and -I work both from command-line and in the Dialyzer GUI; the
syntax of defines and includes is the same as that used by erlc.

Warning options:
-W no_return Suppress warnings for functions of no return.
-W no_unused Suppress warnings for unused functions.
-W no_improper_lists Suppress warnings for construction of improper lists.
-W no_fun_app Suppress warnings for fun applications that will fail.
-W match Suppress warnings for pattern matching operations that will never succeed.
-W error handling*** Include warnings for functions that only return by means of an
  exception.

*** This is the only option that turns on warnings rather than turning them off.
Using the Dialyzer from Erlang

You can also use Dialyzer directly from Erlang. Both the gui and the command line version is available. The options are similar to the ones given from the command line, so please refer to the sections above for a description of these.

Exports

gui() -> ok | {error, Msg}
gui(OptList) -> ok | {error, Msg}

Types:
- OptList - see below

Dialyzer GUI version.

OptList : [Option]
Option : {files, 
    [Filename : string()]
    | {files_rec, 
        [DirName : string()]
    | {defines, 
        [{Macro: atom(), Value : term()}]
    | {from, 
        src_code | byte_code} %% Defaults to byte_code
    | {init_plt, 
        FileName : string()} %% If changed from default
    | {include_dirs, 
        [DirName : string()]
    | {output_file, 
        FileName : string()}
    | {supress_inline, bool()} %% Defaults to true
    | {warnings, 
        [WarnOpts]}

WarnOpts : no_return
    | no_unused
    | no_improper_lists
    | no_fun_app
    | no_match
    | no_fail_call
    | error_handling

run(OptList) -> {ok, Warnings, Errors} | {ok, Warnings} | {error, Message}

Types:
- OptList - see gui/0,1
- Warnings - see below
- Errors = [string()]
- Message = string()

Dialyzer command line version.
Warnings :: [{Tag, Id, Msg}]

Tag : 'warn_return_no_exit' | 'warn_return_only_exit'
  | 'warn_not_called' | 'warn_non_proper_list'
  | 'warn_fun_app' | 'warn_matching'
  | 'warn_failing_call' | 'warn_contract_types'
  | 'warn_contract_syntax' | 'warn_contract_not_equal'
  | 'warn_contract_subtype' | 'warn_contract_supertype'

Id = {File :: string(), Line :: integer()}

Msg = msg() -- To be used as an argument to dialyzer:format_warning/1

format_warning(Msg) -> string()

Types:
  •(Msg = msg()) - See run/1

Get a string from the message part of the warning as returned by dialyzer:run/1.
Index of Modules and Functions
