Crypto Application

version 1.6
Typeset in \LaTeX{} from SGML source using the DocBuilder-0.9.8.5 Document System.
Chapter 1

Crypto User’s Guide

The Crypto application provides functions for computation of message digests, and functions for encryption and decryption.

This product includes software developed by the OpenSSL Project for use in the OpenSSL Toolkit (http://www.openssl.org/).

This product includes cryptographic software written by Eric Young (eay@cryptsoft.com).

This product includes software written by Tim Hudson (tjh@cryptsoft.com).

For full OpenSSL and SSLeay license texts, see Licenses [page 1].

1.1 Licenses

This chapter contains in extenso versions of the OpenSSL and SSLeay licenses.

1.1.1 OpenSSL License

Crypto Reference Manual

Short Summaries

- Application **crypto** [page 8] – The Crypto Application
- Erlang Module **crypto** [page 10] – Crypto Functions

**crypto**

No functions are exported.

**crypto**

The following functions are exported:

- `start() -> ok`
  [page 10] Start the crypto server.
- `stop() -> ok`
  [page 10] Stop the crypto server.
- `info() -> [atom()]`
  [page 10] Provide a list of available crypto functions.
- `info_lib() -> [{Name,VerNum,VerStr}]`
  [page 10] Provides information about the libraries used by crypto.
- `md5(Data) -> Digest`
  [page 11] Compute an MD5 message digest from Data
- `md5_init() -> Context`
  [page 11] Creates an MD5 context
- `md5_update(Context, Data) -> NewContext`
  [page 11] Update an MD5 Context with Data, and return a NewContext
- `md5_final(Context) -> Digest`
  [page 11] Finish the update of an MD5 Context and return the computed MD5 message digest
- `sha(Data) -> Digest`
  [page 11] Compute an SHA message digest from Data
- `sha_init() -> Context`
  [page 11] Create an SHA context
- `sha_update(Context, Data) -> NewContext`
  [page 12] Update an SHA context
sha_final(Context) -> Digest
[page 12] Finish the update of an SHA context

md5_mac(Key, Data) -> Mac
[page 12] Compute an MD5 MACmessage authentification code

md5_mac_96(Key, Data) -> Mac
[page 12] Compute an MD5 MACmessage authentification code

sha_mac(Key, Data) -> Mac
[page 12] Compute an MD5 MACmessage authentification code

sha_mac_96(Key, Data) -> Mac
[page 12] Compute an MD5 MACmessage authentification code

des_cbc_encrypt(Key, IVec, Text) -> Cipher
[page 12] Encrypt Text according to DES in CBC mode

des_cbc_decrypt(Key, IVec, Cipher) -> Text
[page 13] Decrypt Cipher according to DES in CBC mode

des3_cbc_encrypt(Key1, Key2, Key3, IVec, Text) -> Cipher
[page 13] Encrypt Text according to DES3 in CBC mode

des3_cbc_decrypt(Key1, Key2, Key3, IVec, Cipher) -> Text
[page 13] Decrypt Cipher according to DES in CBC mode

aes_cfb_128_encrypt(Key, IVec, Text) -> Cipher
[page 13] Encrypt Text according to AES in Cipher Feedback mode or Cipher Block Chaining mode

aes_cbc_128_encrypt(Key, IVec, Text) -> Cipher
[page 13] Encrypt Text according to AES in Cipher Feedback mode or Cipher Block Chaining mode

aes_cfb_128_decrypt(Key, IVec, Cipher) -> Text
[page 13] Decrypt Cipher according to AES in Cipher Feedback mode or Cipher Block Chaining mode

aes_cbc_128_decrypt(Key, IVec, Cipher) -> Text
[page 13] Decrypt Cipher according to AES in Cipher Feedback mode or Cipher Block Chaining mode

erlint(Mpint) -> N
[page 14] Convert between binary multi-precision integer and erlang big integer

mpint(N) -> Mpint
[page 14] Convert between binary multi-precision integer and erlang big integer

rand_bytes(N) -> binary()
[page 14] Generate a binary of random bytes

rand_uniform(Lo, Hi) -> N
[page 14] Generate a random number

mod_exp(N, P, M) -> Result
[page 14] Perform N ^ P mod M

rsa_sign(Data, Key) -> Signature
[page 14] Sign the data using rsa with the given key.

rsa_sign(DigestType, Data, Key) -> Signature
[page 14] Sign the data using rsa with the given key.

rsa_verify(Data, Signature, Key) -> Verified
[page 15] Verify the digest and signature using rsa with given public key.
- `rsa_verify(DigestType, Data, Signature, Key) -> Verified`  
  [page 15] Verify the digest and signature using rsa with given public key.

- `rsa_public_encrypt(PlainText, PublicKey, Padding) -> ChipherText`  
  [page 15] Encrypts Msg using the public Key.

- `rsa_private_decrypt(ChipherText, PrivateKey, Padding) -> PlainText`  
  [page 15] Decrypts ChipherText using the private Key.

- `rsa_private_encrypt(PlainText, PrivateKey, Padding) -> ChipherText`  
  [page 16] Encrypts Msg using the private Key.

- `rsa_public_decrypt(ChipherText, PublicKey, Padding) -> PlainText`  
  [page 16] Decrypts ChipherText using the public Key.

- `dss_sign(Data, Key) -> Signature`  
  [page 16] Sign the data using dsa with given private key.

- `dss_verify(Data, Signature, Key) -> Verified`  
  [page 16] Verify the data and signature using dsa with given public key.

- `rc4_encrypt(Key, Data) -> Result`  
  [page 17] Encrypt data using RC4

- `dh_generate_key(DHParams) -> {PublicKey,PrivateKey}`  
  [page 17] Generates a Diffie-Hellman public key

- `dh_generate_key(PrivateKey, DHParams) -> {PublicKey,PrivateKey}`  
  [page 17] Generates a Diffie-Hellman public key

- `dh_compute_key(OthersPublicKey, MyPrivateKey, DHParams) -> SharedSecret`  
  [page 17] Computes the shared secret

- `exor(Data1, Data2) -> Result`  
  [page 17] XOR data
The purpose of the Crypto application is to provide message digest and DES encryption for SMNPv3. It provides computation of message digests MD5 and SHA, and CBC-DES encryption and decryption.

Configuration

The following environment configuration parameters are defined for the Crypto application. Refer to application(3) for more information about configuration parameters.

```
debug = true | false <optional> Causes debug information to be written to standard error or standard output. Default is false.
```

OpenSSL libraries

The current implementation of the Erlang Crypto application is based on the OpenSSL package version 0.9.7 or higher. There are source and binary releases on the web. Source releases of OpenSSL can be downloaded from the OpenSSL¹ project home page, or mirror sites listed there. The same URL also contains links to some compiled binaries and libraries of OpenSSL (see the Related/Binaries menu) of which the Shining Light Productions Win32 and OpenSSL² pages are of interest for the Win32 user.

For some Unix flavours there are binary packages available on the net.

If you cannot find a suitable binary OpenSSL package, you have to fetch an OpenSSL source release and compile it.

You then have to compile and install the library libcrypto.so (Unix), or the library libeay32.dll (Win32).

For Unix The crypto_drv dynamic driver is delivered linked to OpenSSL libraries in /usr/local/lib, but the default dynamic linking will also accept libraries in /lib and /usr/lib.

If that is not applicable to the particular Unix operating system used, the example Makefile in the Crypto priv/obj directory, should be used as a basis for relinking the final version of the port program.

For Win32 it is only required that the library can be found from the PATH environment variable, or that they reside in the appropriate SYSTEM32 directory; hence no particular relinking is need. Hence no example Makefile for Win32 is provided.

The above publications can be found at NIST publications\(^3\), at IETF\(^4\).

Types

\begin{verbatim}
byte() = 0 ... 255
ioelem() = byte() | binary() | iolist()
iolist() = [ioelem()]
Mpint() = <<ByteLen:32/integer-big, Bytes:ByteLen/binary>>
\end{verbatim}

Exports

\begin{verbatim}
start() -> ok
Starts the crypto server.

stop() -> ok
Stops the crypto server.

info() -> [atom()]
Provides the available crypto functions in terms of a list of atoms.

info_lib() -> [{Name,VerNum,VerStr}]
\end{verbatim}

\(^3\)URL: http://csrc.nist.gov/publications
\(^4\)URL: http://www.ietf.org
Types:
- Name = binary()
- VerNum = integer()
- VerStr = binary()

Provides the name and version of the libraries used by crypto. Name is the name of the library. VerNum is the numeric version according to the library’s own versioning scheme. VerStr contains a text variant of the version.

```prolog
> info_lib().
[{{"OpenSSL"},9469983},{{"OpenSSL 0.9.8a 11 Oct 2005"}}]
```

\[\text{md5(Data) -> Digest}\]

Types:
- Data = iolist() | binary()
- Digest = binary()

Computes an MD5 message digest from Data, where the length of the digest is 128 bits (16 bytes).

\[\text{md5_init() -> Context}\]

Types:
- Context = binary()

Creates an MD5 context, to be used in subsequent calls to \text{md5_update/2}.

\[\text{md5_update(Context, Data) -> NewContext}\]

Types:
- Data = iolist() | binary()
- Context = NewContext = binary()

Updates an MD5 Context with Data, and returns a NewContext.

\[\text{md5_final(Context) -> Digest}\]

Types:
- Context = Digest = binary()

Finishes the update of an MD5 Context and returns the computed MD5 message digest.

\[\text{sha(Data) -> Digest}\]

Types:
- Data = iolist() | binary()
- Digest = binary()

Computes an SHA message digest from Data, where the length of the digest is 160 bits (20 bytes).

\[\text{sha_init() -> Context}\]

Types:
crypto

- Context = binary()

Creates an SHA context, to be used in subsequent calls to sha_update/2.

sha_update(Context, Data) -> NewContext

Types:
- Data = iolist() | binary()
- Context = NewContext = binary()

Updates an SHA Context with Data, and returns a NewContext.

sha_final(Context) -> Digest

Types:
- Context = Digest = binary()

Finishes the update of an SHA Context and returns the computed SHA message digest.

md5_mac(Key, Data) -> Mac

Types:
- Key = Data = iolist() | binary()
- Mac = binary()

Computes an MD5 MAC message authentication code from Key and Data, where the length of the Mac is 128 bits (16 bytes).

md5_mac_96(Key, Data) -> Mac

Types:
- Key = Data = iolist() | binary()
- Mac = binary()

Computes an MD5 MAC message authentication code from Key and Data, where the length of the Mac is 96 bits (12 bytes).

sha_mac(Key, Data) -> Mac

Types:
- Key = Data = iolist() | binary()
- Mac = binary()

Computes an SHA MAC message authentication code from Key and Data, where the length of the Mac is 160 bits (20 bytes).

sha_mac_96(Key, Data) -> Mac

Types:
- Key = Data = iolist() | binary()
- Mac = binary()

Computes an SHA MAC message authentication code from Key and Data, where the length of the Mac is 96 bits (12 bytes).

des_cbc_encrypt(Key, IVec, Text) -> Cipher
Types:
- Key = Text = iolist() | binary()
- IVec = Cipher = binary()

Encrypts Text according to DES in CBC mode. Text must be a multiple of 64 bits (8 bytes). Key is the DES key, and IVec is an arbitrary initializing vector. The lengths of Key and IVec must be 64 bits (8 bytes).

des_cbc_decrypt(Key, IVec, Cipher) -> Text

Types:
- Key = Cipher = iolist() | binary()
- IVec = Text = binary()

Decrypts Cipher according to DES in CBC mode. Key is the DES key, and IVec is an arbitrary initializing vector. Key and IVec must have the same values as those used when encrypting. Cipher must be a multiple of 64 bits (8 bytes). The lengths of Key and IVec must be 64 bits (8 bytes).

des3_cbc_encrypt(Key1, Key2, Key3, IVec, Text) -> Cipher

Types:
- Key1 =Key2 =Key3 Text = iolist() | binary()
- IVec = Cipher = binary()

Encrypts Text according to DES3 in CBC mode. Text must be a multiple of 64 bits (8 bytes). Key1, Key2, Key3, are the DES keys, and IVec is an arbitrary initializing vector. The lengths of each of Key1, Key2, Key3 and IVec must be 64 bits (8 bytes).

des3_cbc_decrypt(Key1, Key2, Key3, IVec, Cipher) -> Text

Types:
- Key1 =Key2 =Key3 =Cipher = iolist() | binary()
- IVec = Text = binary()

Decrypts Cipher according to DES3 in CBC mode. Key1, Key2, Key3, are the DES key, and IVec is an arbitrary initializing vector. Key1, Key2, Key3 and IVec must and IVec must have the same values as those used when encrypting. Cipher must be a multiple of 64 bits (8 bytes). The lengths of Key1, Key2, Key3, and IVec must be 64 bits (8 bytes).

aes_cfb_128_encrypt(Key, IVec, Text) -> Cipher

Types:
- Key = Text = iolist() | binary()
- IVec = Cipher = binary()

Encrypts Text according to AES in Cipher Feedback mode (CFB) or Cipher Block Chaining mode (CBC). Text must be a multiple of 128 bits (16 bytes). Key is the AES key, and IVec is an arbitrary initializing vector. The lengths of Key and IVec must be 128 bits (16 bytes).

aes_cfb_128_decrypt(Key, IVec, Cipher) -> Text

aes_cbc_128_encrypt(Key, IVec, Text) -> Cipher

Types:
- Key = Text = iolist() | binary()
- IVec = Cipher = binary()

Encrypts Text according to AES in Cipher Feedback mode (CFB) or Cipher Block Chaining mode (CBC). Text must be a multiple of 128 bits (16 bytes). Key is the AES key, and IVec is an arbitrary initializing vector. The lengths of Key and IVec must be 128 bits (16 bytes).

aes_cfb_128_decrypt(Key, IVec, Cipher) -> Text

aes_cbc_128_decrypt(Key, IVec, Cipher) -> Text
Types:
- Key = Cipher = iolist() | binary()
- IVec = Text = binary()

Decrypts Cipher according to Cipher Feedback Mode (CFB) or Cipher Block Chaining mode (CBC). Key is the AES key, and IVec is an arbitrary initializing vector. Key and IVec must have the same values as those used when encrypting. Cipher must be a multiple of 128 bits (16 bytes). The lengths of Key and IVec must be 128 bits (16 bytes).

erlint(Mpint) -> N
mpint(N) -> Mpint

Types:
- Mpint = binary()
- N = integer()

Convert a binary multi-precision integer Mpint to and from an erlang big integer. A multi-precision integer is a binary with the following form: <<ByteLen:32/integer, Bytes:ByteLen/binary>>, where both ByteLen and Bytes are big-endian. Mpints are used in some of the functions in crypto and are not translated in the API for performance reasons.

rand_bytes(N) -> binary()

Types:
- N = integer()

Generates N bytes randomly uniform 0..255, and returns the result in a binary. Uses the crypto library pseudo-random number generator.

rand_uniform(Lo, Hi) -> N

Types:
- Lo, Hi, N = Mpint | integer()
- Mpint = binary()

Generate a random number N, Lo =< N < Hi. Uses the crypto library pseudo-random number generator. The arguments (and result) can be either erlang integers or binary multi-precision integers.

mod_exp(N, P, M) -> Result

Types:
- N, P, M, Result = Mpint
- Mpint = binary()

This function performs the exponentiation N^P mod M, using the crypto library.

rsa_sign(Data, Key) -> Signature
rsa_sign(DigestType, Data, Key) -> Signature

Types:
- Data = Mpint
Crypto Reference Manual

- Key = [E, N, D]
  E, N, D = Mpint
  Where E is the public exponent, N is public modulus and D is the private exponent.
- DigestType = md5 | sha
  The default DigestType is sha.
- Mpint = binary()
- Signature = binary()

Calculates a DigestType digest of the Data and creates a RSA signature with the private key Key of the digest.

```plaintext
rsa_verify(Data, Signature, Key) -> Verified
rsa_verify(DigestType, Data, Signature, Key) -> Verified
```

Types:
- Verified = boolean()
- Data, Signature = Mpint
- Key = [E, N]
- E, N = Mpint
  Where E is the public exponent and N is public modulus.
- DigestType = md5 | sha
  The default DigestType is sha.
- Mpint = binary()

Calculates a DigestType digest of the Data and verifies that the digest matches the RSA signature using the signer's public key Key.

```plaintext
rsa_public_encrypt(PlainText, PublicKey, Padding) -> ChipherText
```

Types:
- PlainText = binary()
- PublicKey = [E, N, D]
- E, N = Mpint
  Where E is the public exponent and N is public modulus.
- Padding = rsa_pkcs1_padding | rsa_pkcs1_oaep_padding | rsa_no_padding
- ChipherText = binary()

Encrypts the PlainText (usually a session key) using the PublicKey and returns the chipher. The Padding decides what padding mode is used. rsa_pkcs1_padding is PKCS #1 v1.5 currently the most used mode and rsa_pkcs1_oaep_padding is EM E O AEP as defined in PKCS #1 v2.0 with SHA-1, MGF1 and an empty encoding parameter. This mode is recommended for all new applications. The size of the Msg must be less than byte_size(N)-11 if rsa_pkcs1_padding is used, byte_size(N)-41 if rsa_pkcs1_oaep_padding is used and byte_size(N) if rsa_no_padding is used. Where byte_size(N) is the size part of an Mpint-1.

```plaintext
rsa_private_decrypt(ChipherText, PrivateKey, Padding) -> PlainText
```

Types:
- ChipherText = binary()
- PrivateKey = [E, N, D]
E, N, D = \text{Mpint} \\
\text{Where } E \text{ is the public exponent, } N \text{ is public modulus and } D \text{ is the private exponent.}

Padding = rsa\_pkcs1\_padding \mid rsa\_pkcs1\_oaep\_padding \mid rsa\_no\_padding

PlainText = \text{binary()}

Decrypts the ChipherText (usually a session key encrypted with rsa\_public\_encrypt/3 [page 15]) using the PrivateKey and returns the message. The Padding is the padding mode that was used to encrypt the data, see rsa\_public\_encrypt/3 [page 15].

\textbf{rsa\_private\_encrypt(PlainText, PrivateKey, Padding) \rightarrow ChipherText}

Types:
- PlainText = \text{binary()}
- PrivateKey = [E, N, D]
- E, N, D = \text{Mpint} \\
\text{Where } E \text{ is the public exponent, } N \text{ is public modulus and } D \text{ is the private exponent.}
- Padding = rsa\_pkcs1\_padding \mid rsa\_no\_padding
- ChipherText = \text{binary()}

Encrypts the PlainText using the PrivateKey and returns the chipher. The Padding decides what padding mode is used, rsa\_pkcs1\_padding is PKCS #1 v1.5 currently the most used mode. The size of the \text{Msg} must be less than byte\_size(N)-11 if rsa\_pkcs1\_padding is used, and byte\_size(N) if rsa\_no\_padding is used. Where \text{byte\_size(N)} is the size part of an \text{Mpint}-1.

\textbf{rsa\_public\_decrypt(ChipherText, PublicKey, Padding) \rightarrow PlainText}

Types:
- ChipherText = \text{binary()}
- PublicKey = [E, N] \\
\text{E, N = \text{Mpint} \\
\text{Where } E \text{ is the public exponent and } N \text{ is public modulus}}
- Padding = rsa\_pkcs1\_padding \mid rsa\_no\_padding
- PlainText = \text{binary()}

Decrypts the ChipherText (encrypted with rsa\_private\_encrypt/3 [page 16]) using the PrivateKey and returns the message. The Padding is the padding mode that was used to encrypt the data, see rsa\_private\_encrypt/3 [page 16].

\textbf{dss\_sign(Data, Key) \rightarrow Signature}

Types:
- Digest = \text{Mpint}
- Key = [P, Q, G, X] \\
\text{P, Q, G, X = \text{Mpint} \\
\text{Where } P, Q \text{ and } G \text{ are the dss parameters and } X \text{ is the private key.}
- Mpint = \text{binary()}
- Signature = \text{binary()}

Calculates the sha digest of the Data and creates a DSS signature with the private key Key of the digest.

\textbf{dss\_verify(Data, Signature, Key) \rightarrow Verified}
Types:
- Verified = boolean()
- Digest, Signature = Mpint
- Key = [P, Q, G, Y]
  Where P, Q and G are the dss parameters and Y is the public key.
- Mpint = binary()
Calculates the sha digest of the Data and verifies that the digest matches the DSS signature using the public key Key.

rc4_encrypt(Key, Data) -> Result
Types:
- Key, Data = iolist() | binary()
- Result = binary()
Encrypts the data with RC4 symmetric stream encryption. Since it is symmetric, the same function is used for decryption.

dh_generate_key(DHParams) -> {PublicKey, PrivateKey}
dh_generate_key(PrivateKey, DHParams) -> {PublicKey, PrivateKey}
Types:
- DHParameters = [P, G]
  Where P is the shared prime number and G is the shared generator.
- PublicKey, PrivateKey = Mpint()
  Generates a Diffie-Hellman PublicKey and PrivateKey (if not given).

dh_compute_key(OthersPublicKey, MyPrivateKey, DHParams) -> SharedSecret
Types:
- DHParameters = [P, G]
  Where P is the shared prime number and G is the shared generator.
- OthersPublicKey, MyPrivateKey = Mpint()
  SharedSecret = binary()
Computes the shared secret from the private key and the other party's public key.

exor(Data1, Data2) -> Result
Types:
- Data1, Data2 = iolist() | binary()
- Result = binary()
Performs bit-wise XOR (exclusive or) on the data supplied.
DES in CBC mode

The Data Encryption Standard (DES) defines an algorithm for encrypting and decrypting an 8 byte quantity using an 8 byte key (actually only 56 bits of the key is used).

When it comes to encrypting and decrypting blocks that are multiples of 8 bytes various modes are defined (NIST SP 800-38A). One of those modes is the Cipher Block Chaining (CBC) mode, where the encryption of an 8 byte segment depend not only of the contents of the segment itself, but also on the result of encrypting the previous segment: the encryption of the previous segment becomes the initializing vector of the encryption of the current segment.

Thus the encryption of every segment depends on the encryption key (which is secret) and the encryption of the previous segment, except the first segment which has to be provided with an initial initializing vector. That vector could be chosen at random, or be a counter of some kind. It does not have to be secret.

The following example is drawn from the old FIPS 81 standard (replaced by NIST SP 800-38A), where both the plain text and the resulting cipher text is settled. The following code fragment returns 'true'.

```erlang
Key = <<16#01,16#23,16#45,16#67,16#89,16#ab,16#cd,16#ef>>,
IVec = <<16#12,16#34,16#56,16#78,16#90,16#ab,16#cd,16#ef>>,
P = "Now is the time for all ",
C = crypto:des_cbc_encrypt(Key, IVec, P),
% Which is the same as
P1 = "Now is t", P2 = "he time ", P3 = "for all ",
C1 = crypto:des_cbc_encrypt(Key, IVec, P1),
C2 = crypto:des_cbc_encrypt(Key, C1, P2),
C3 = crypto:des_cbc_encrypt(Key, C2, P3),
C = <<C1/binary, C2/binary, C3/binary>>,
C = <<16#e5,16#c7,16#cd,16#de,16#e7,16#f2,16#7c,
  16#43,16#e9,16#34,16#00,16#8c,16#38,16#9c,16#0f,
  16#68,16#37,16#88,16#49,16#9a,16#7c,16#05,16#f6>>,
<<"Now is the time for all ">> ==
  crypto:des_cbc_decrypt(Key, IVec, C).
```

The following is true for the DES CBC mode. For all decompositions \(P_1 + P_2 = P\) of a plain text message \(P\) (where the length of all quantities are multiples of 8 bytes), the encryption \(C\) of \(P\) is equal to \(C_1 + C_2\), where \(C_1\) is obtained by encrypting \(P_1\) with \(Key\) and the initializing vector \(IVec\), and where \(C_2\) is obtained by encrypting \(P_2\) with \(Key\) and the initializing vector \(last8(C_1)\), where \(last8(Binary)\) denotes the last 8 bytes of the binary \(Binary\).

Similarly, for all decompositions \(C_1 + C_2 = C\) of a cipher text message \(C\) (where the length of all quantities are multiples of 8 bytes), the decryption \(P\) of \(C\) is equal to \(P_1 + P_2\), where \(P_1\) is obtained by decrypting \(C_1\) with \(Key\) and the initializing vector \(IVec\), and where \(P_2\) is obtained by decrypting \(C_2\) with \(Key\) and the initializing vector \(last8(C_1)\), where \(last8(Binary)\) is as above.

For DES3 (which uses three 64 bit keys) the situation is the same.
