Chapter 1

Crypto User’s Guide

The Crypto application provides functions for computation of message digests, and functions for encryption and decryption.

This product includes software developed by the OpenSSL Project for use in the OpenSSL Toolkit (http://www.openssl.org/).

This product includes cryptographic software written by Eric Young (eay@cryptsoft.com).

This product includes software written by Tim Hudson (tjh@cryptsoft.com).

For full OpenSSL and SSLeay license texts, see Licenses [page 1].

1.1 Licenses

This chapter contains in extenso versions of the OpenSSL and SSLeay licenses.

1.1.1 OpenSSL License

Crypto Reference Manual

Short Summaries

- Application **crypto** [page 8] – The Crypto Application
- Erlang Module **crypto** [page 10] – Crypto Functions

**crypto**

No functions are exported.

**crypto**

The following functions are exported:

- `start() -> ok`
  [page 10] Start the crypto server.
- `stop() -> ok`
  [page 10] Stop the crypto server.
- `info() -> [atom()]`
  [page 10] Provide a list of available crypto functions.
- `info_lib() -> [{Name,VerNum,VerStr}]`
  [page 10] Provides information about the libraries used by crypto.
- `md5(Data) -> Digest`
  [page 11] Compute an MD5 message digest from `Data`
- `md5_init() -> Context`
  [page 11] Creates an MD5 context
- `md5_update(Context, Data) -> NewContext`
  [page 11] Update an MD5 Context with `Data`, and return a `NewContext`
- `md5_final(Context) -> Digest`
  [page 11] Finish the update of an MD5 Context and return the computed MD5 message digest
- `sha(Data) -> Digest`
  [page 11] Compute an SHA message digest from `Data`
- `sha_init() -> Context`
  [page 11] Create an SHA context
- `sha_update(Context, Data) -> NewContext`
  [page 12] Update an SHA context
- `sha_final(Context)` -> Digest
  [page 12] Finish the update of an SHA context

- `md5_mac(Key, Data)` -> Mac
  [page 12] Compute an MD5 MAC message authentification code

- `md5_mac_96(Key, Data)` -> Mac
  [page 12] Compute an MD5 MAC message authentification code

- `sha_mac(Key, Data)` -> Mac
  [page 12] Compute an MD5 MAC message authentification code

- `sha_mac_96(Key, Data)` -> Mac
  [page 12] Compute an MD5 MAC message authentification code

- `des_cbc_encrypt(Key, IVec, Text)` -> Cipher
  [page 12] Encrypt Text according to DES in CBC mode

- `des_cbc_decrypt(Key, IVec, Cipher)` -> Text
  [page 13] Decrypt Cipher according to DES in CBC mode

- `des_cbc_ivec(Data)` -> IVec
  [page 13] Get IVec to be used in next iteration of des_cbc_[encrypt|decrypt]

- `des3_cbc_encrypt(Key1, Key2, Key3, IVec, Text)` -> Cipher
  [page 13] Encrypt Text according to DES3 in CBC mode

- `des3_cbc_decrypt(Key1, Key2, Key3, IVec, Cipher)` -> Text
  [page 13] Decrypt Cipher according to DES in CBC mode

- `blowfish_cfb64_encrypt(Key, IVec, Text)` -> Cipher
  [page 13] Encrypt Text using Blowfish in CFB mode with 64 bit feedback

- `blowfish_cfb64_decrypt(Key, IVec, Cipher)` -> Text
  [page 14] Decrypt Cipher using Blowfish in CFB mode with 64 bit feedback

- `aes_cfb_128_encrypt(Key, IVec, Text)` -> Cipher
  [page 14] Encrypt Text according to AES in Cipher Feedback mode or Cipher Block Chaining mode

- `aes_cbc_128_encrypt(Key, IVec, Text)` -> Cipher
  [page 14] Encrypt Text according to AES in Cipher Feedback mode or Cipher Block Chaining mode

- `aes_cfb_128_decrypt(Key, IVec, Cipher)` -> Text
  [page 14] Decrypt Cipher according to AES in Cipher Feedback mode or Cipher Block Chaining mode

- `aes_cbc_128_decrypt(Key, IVec, Cipher)` -> Text
  [page 14] Decrypt Cipher according to AES in Cipher Feedback mode or Cipher Block Chaining mode

- `aes_cbc_ivec(Data)` -> IVec
  [page 14] Get IVec to be used in next iteration of aes_cbc_*[encrypt|decrypt]

- `erlint(Mpint)` -> N
  [page 14] Convert between binary multi-precision integer and erlang big integer

- `mpint(N)` -> Mpint
  [page 14] Convert between binary multi-precision integer and erlang big integer

- `rand_bytes(N)` -> binary()
  [page 15] Generate a binary of random bytes

- `rand_uniform(Lo, Hi)` -> N
  [page 15] Generate a random number
• mod_exp(N, P, M) -> Result
  [page 15] Perform N^P mod M
• rsa_sign(Data, Key) -> Signature
  [page 15] Sign the data using rsa with the given key.
• rsa_sign(DigestType, Data, Key) -> Signature
  [page 15] Sign the data using rsa with the given key.
• rsa_verify(Data, Signature, Key) -> Verified
  [page 15] Verify the digest and signature using rsa with given public key.
• rsa_verify(DigestType, Data, Signature, Key) -> Verified
  [page 15] Verify the digest and signature using rsa with given public key.
• rsa_public_encrypt(PlainText, PublicKey, Padding) -> ChipherText
  [page 16] Encrypts Msg using the public Key.
• rsa_private_decrypt(ChipherText, PrivateKey, Padding) -> PlainText
  [page 16] Decrypts ChipherText using the private Key.
• rsa_private_encrypt(PlainText, PrivateKey, Padding) -> ChipherText
  [page 16] Encrypts Msg using the private Key.
• rsa_public_decrypt(ChipherText, PublicKey, Padding) -> PlainText
  [page 17] Decrypts ChipherText using the public Key.
• dss_sign(Data, Key) -> Signature
  [page 17] Sign the data using dsa with given private key.
• dss_verify(Data, Signature, Key) -> Verified
  [page 17] Verify the data and signature using dsa with given public key.
• rc4_encrypt(Key, Data) -> Result
  [page 17] Encrypt data using RC4
• dh_generate_key(DHParams) -> {PublicKey,PrivateKey}
  [page 18] Generates a Diffie-Hellman public key
• dh_generate_key(PrivateKey, DHParams) -> {PublicKey,PrivateKey}
  [page 18] Generates a Diffie-Hellman public key
• dh_compute_key(OtherPublicKey, MyPrivateKey, DHParams) ->
  SharedSecret
  [page 18] Computes the shared secret
• exor(Data1, Data2) -> Result
  [page 18] XOR data
The purpose of the Crypto application is to provide message digest and DES encryption for SNMPv3. It provides computation of message digests MD5 and SHA, and CBC-DES encryption and decryption.

Configuration

The following environment configuration parameters are defined for the Crypto application. Refer to application(3) for more information about configuration parameters.

debug = true | false <optional> Causes debug information to be written to standard error or standard output. Default is false.

OpenSSL libraries

The current implementation of the Erlang Crypto application is based on the OpenSSL package version 0.9.7 or higher. There are source and binary releases on the web. Source releases of OpenSSL can be downloaded from the OpenSSL\(^1\) project home page, or mirror sites listed there.

The same URL also contains links to some compiled binaries and libraries of OpenSSL (see the Related/Binaries menu) of which the Shining Light Productions Win32 and OpenSSL\(^2\) pages are of interest for the Win32 user.

For some Unix flavours there are binary packages available on the net.

If you cannot find a suitable binary OpenSSL package, you have to fetch an OpenSSL source release and compile it.

You then have to compile and install the library libcrypto.so (Unix), or the library libeay32.dll (Win32).

For Unix The crypto_drv dynamic driver is delivered linked to OpenSSL libraries in /usr/local/lib, but the default dynamic linking will also accept libraries in /lib and /usr/lib.

If that is not applicable to the particular Unix operating system used, the example Makefile in the Crypto priv/obj directory, should be used as a basis for relinking the final version of the port program.

For Win32 it is only required that the library can be found from the PATH environment variable, or that they reside in the appropriate SYSTEM32 directory; hence no particular relinking is need. Hence no example Makefile for Win32 is provided.

Erlang Module

This module provides a set of cryptographic functions.

References:

- md5: The MD5 Message Digest Algorithm (RFC 1321)
- sha: Secure Hash Standard (FIPS 180-2)
- hmac: Keyed-Hashing for Message Authentication (RFC 2104)
- des: Data Encryption Standard (FIPS 46-3)
- aes: Advanced Encryption Standard (AES) (FIPS 197)
- ecb, cbc, cfb, ofb: Recommendation for Block Cipher Modes of Operation (NIST SP 800-38A).
- rsa: Recommendation for Block Cipher Modes of Operation (NIST 800-38A)
- dss: Digital Signature Standard (FIPS 186-2)

The above publications can be found at NIST publications\(^3\), at IETF\(^4\).

Types

- `byte() = 0 ... 255`
- `ioelem() = byte() | binary() | iolist()`
- `iolist() = [ioelem()]`
- `Mpint() = <<ByteLen:32/integer-big, Bytes:ByteLen/binary>>`

Exports

- `start() -> ok`
  Starts the crypto server.
- `stop() -> ok`
  Stops the crypto server.
- `info() -> [atom()]`
  Provides the available crypto functions in terms of a list of atoms.
- `info_lib() -> [{Name,VerNum,VerStr}]`

\(^3\)URL: http://csrc.nist.gov/publications
\(^4\)URL: http://www.ietf.org
Types:
  • Name = binary()
  • VerNum = integer()
  • VerStr = binary()

Provides the name and version of the libraries used by crypto.
Name is the name of the library. VerNum is the numeric version according to the library's own versioning scheme. VerStr contains a text variant of the version.

```erl
> info_lib().
["<<"OpenSSL">>,9469983,"<<"OpenSSL 0.9.8a 11 Oct 2005">>]
```

```erl
md5(Data) -> Digest
Types:
  • Data = iolist() | binary()
  • Digest = binary()
Computes an MD5 message digest from Data, where the length of the digest is 128 bits (16 bytes).

md5_init() -> Context
Types:
  • Context = binary()
Creates an MD5 context, to be used in subsequent calls to md5_update/2.

md5_update(Context, Data) -> NewContext
Types:
  • Data = iolist() | binary()
  • Context = NewContext = binary()
Updates an MD5 Context with Data, and returns a NewContext.

md5_final(Context) -> Digest
Types:
  • Context = Digest = binary()
Finishes the update of an MD5 Context and returns the computed MD5 message digest.

sha(Data) -> Digest
Types:
  • Data = iolist() | binary()
  • Digest = binary()
Computes an SHA message digest from Data, where the length of the digest is 160 bits (20 bytes).

sha_init() -> Context
Types:
• Context = binary()

Creates an SHA context, to be used in subsequent calls to sha_update/2.

sha_update(Context, Data) -> NewContext

Types:
• Data = iolist() | binary()
• Context = NewContext = binary()

Updates an SHA Context with Data, and returns a NewContext.

sha_final(Context) -> Digest

Types:
• Context = Digest = binary()

Finishes the update of an SHA Context and returns the computed SHA message digest.

md5_mac(Key, Data) -> Mac

Types:
• Key = Data = iolist() | binary()
• Mac = binary()

Computes an MD5 MAC message authentification code from Key and Data, where the length of the Mac is 128 bits (16 bytes).

md5_mac_96(Key, Data) -> Mac

Types:
• Key = Data = iolist() | binary()
• Mac = binary()

Computes an MD5 MAC message authentification code from Key and Data, where the length of the Mac is 96 bits (12 bytes).

sha_mac(Key, Data) -> Mac

Types:
• Key = Data = iolist() | binary()
• Mac = binary()

Computes an SHA MAC message authentification code from Key and Data, where the length of the Mac is 160 bits (20 bytes).

sha_mac_96(Key, Data) -> Mac

Types:
• Key = Data = iolist() | binary()
• Mac = binary()

Computes an SHA MAC message authentification code from Key and Data, where the length of the Mac is 96 bits (12 bytes).

des_cbc_encrypt(Key, IVec, Text) -> Cipher
Types:
- Key = Text = iolist() \| binary()
- IVec = Cipher = binary()

Encrypts Text according to DES in CBC mode. Text must be a multiple of 64 bits (8 bytes). Key is the DES key, and IVec is an arbitrary initializing vector. The lengths of Key and IVec must be 64 bits (8 bytes).

des\_cbc\_decrypt(Key, IVec, Cipher) -> Text

Types:
- Key = Cipher = iolist() \| binary()
- IVec = Text = binary()

Decrypts Cipher according to DES in CBC mode. Key is the DES key, and IVec is an arbitrary initializing vector. Key and IVec must have the same values as those used when encrypting. Cipher must be a multiple of 64 bits (8 bytes). The lengths of Key and IVec must be 64 bits (8 bytes).

des\_cbc\_ivec(Data) -> IVec

Types:
- Data = iolist() \| binary()
- IVec = binary()

Returns the IVec to be used in a next iteration of des\_cbc\_[encrypt|decrypt]. Data is the encrypted data from the previous iteration step.

des3\_cbc\_encrypt(Key1, Key2, Key3, IVec, Text) -> Cipher

Types:
- Key1 = Key2 = Key3 Text = iolist() \| binary()
- IVec = Cipher = binary()

Encrypts Text according to DES3 in CBC mode. Text must be a multiple of 64 bits (8 bytes). Key1, Key2, Key3 are the DES keys, and IVec is an arbitrary initializing vector. The lengths of each of Key1, Key2, Key3 and IVec must be 64 bits (8 bytes).

des3\_cbc\_decrypt(Key1, Key2, Key3, IVec, Cipher) -> Text

Types:
- Key1 = Key2 = Key3 = Cipher = iolist() \| binary()
- IVec = Text = binary()

Decrypts Cipher according to DES3 in CBC mode. Key1, Key2, Key3 are the DES key, and IVec is an arbitrary initializing vector. Key1, Key2, Key3 and IVec must have the same values as those used when encrypting. Cipher must be a multiple of 64 bits (8 bytes). The lengths of Key1, Key2, Key3, and IVec must be 64 bits (8 bytes).

blowfish\_cfb64\_encrypt(Key, IVec, Text) -> Cipher

Types:
- Key = Text = iolist() \| binary()
- IVec = Cipher = binary()
Encrypts Text using Blowfish in CFB mode with 64 bit feedback. Key is the Blowfish key, and IVec is an arbitrary initializing vector. The length of IVec must be 64 bits (8 bytes).

**`blowfish_cfb64`**

```erlang
blowfish_cfb64_decrypt(Key, IVec, Text) -> Cipher
```

Types:
- `Key = Text = iolist() | binary()`
- `IVec = Cipher = binary()`

Decrypts Text using Blowfish in CFB mode with 64 bit feedback. Key is the Blowfish key, and IVec is an arbitrary initializing vector. The length of IVec must be 64 bits (8 bytes).

**`aes_cfb_128_encrypt(Key, IVec, Text) -> Cipher`**

**`aes_cbc_128_encrypt(Key, IVec, Text) -> Cipher`**

Types:
- `Key = Text = iolist() | binary()`
- `IVec = Cipher = binary()`

Encrypts Text according to AES in Cipher Feedback mode (CFB) or Cipher Block Chaining mode (CBC). Text must be a multiple of 128 bits (16 bytes). Key is the AES key, and IVec is an arbitrary initializing vector. The lengths of Key and IVec must be 128 bits (16 bytes).

**`aes_cfb_128_decrypt(Key, IVec, Cipher) -> Text`**

**`aes_cbc_128_decrypt(Key, IVec, Cipher) -> Text`**

Types:
- `Key = Cipher = iolist() | binary()`
- `IVec = Text = binary()`

Decrypts Cipher according to Cipher Feedback Mode (CFB) or Cipher Block Chaining mode (CBC). Key and IVec must have the same values as those used when encrypting. Cipher must be a multiple of 128 bits (16 bytes). The lengths of Key and IVec must be 128 bits (16 bytes).

**`aes_cbc_ivec(Data) -> IVec`**

Types:
- `Data = iolist() | binary()`
- `IVec = binary()`

Returns the IVec to be used in a next iteration of `aes_cbc_*[encrypt|decrypt]`. Data is the encrypted data from the previous iteration step.

**`erlint(Mpint) -> N`**

**`mpint(N) -> Mpint`**

Types:
- `Mpint = binary()`
- `N = integer()`
Convert a binary multi-precision integer \texttt{Mpint} to and from an erlang big integer. A multi-precision integer is a binary with the following form: \texttt{\langle ByteLen:32/integer, Bytes:ByteLen/binary\rangle} where both ByteLen and Bytes are big-endian. M pints are used in some of the functions in \texttt{crypto} and are not translated in the API for performance reasons.

\texttt{rand\_bytes(N) -> binary()}

Types:
- \texttt{N = integer()}

Generates \texttt{N} bytes randomly uniform 0..255, and returns the result in a binary. Uses the \texttt{crypto} library pseudo-random number generator.

\texttt{rand\_uniform(Lo, Hi) -> N}

Types:
- \texttt{Lo, Hi, N = Mpint | integer()}
- \texttt{Mpint = binary()}

Generate a random number \texttt{N}, \texttt{Lo} =\texttt{\langle N < Hi\rangle}. Uses the \texttt{crypto} library pseudo-random number generator. The arguments (and result) can be either erlang integers or binary multi-precision integers.

\texttt{mod\_exp(N, P, M) -> Result}

Types:
- \texttt{N, P, M, Result = Mpint}
- \texttt{Mpint = binary()}

This function performs the exponentiation \texttt{N^P mod M}, using the \texttt{crypto} library.

\texttt{rsa\_sign(Data, Key) -> Signature}

\texttt{rsa\_sign(DigestType, Data, Key) -> Signature}

Types:
- \texttt{Data = Mpint}
- \texttt{Key = [E, N, D]}
- \texttt{E, N, D = Mpint}
  - \texttt{E} is the public exponent, \texttt{N} is public modulus and \texttt{D} is the private exponent.
- \texttt{DigestType = md5 | sha}
  - The default DigestType is \texttt{sha}.
- \texttt{Mpint = binary()}
- \texttt{Signature = binary()}

Calculates a DigestType digest of the \texttt{Data} and creates a RSA signature with the private key \texttt{Key} of the digest.

\texttt{rsa\_verify(Data, Signature, Key) -> Verified}

\texttt{rsa\_verify(DigestType, Data, Signature, Key) -> Verified}

Types:
- \texttt{Verified = boolean()}
- \texttt{Data, Signature = Mpint}
• Key = [E, N]
  E, N = Mpint
  Where E is the public exponent and N is public modulus.
• DigestType = md5 \| sha
  The default DigestType is sha.
• M p i n t = binary()

Calculates a DigestType digest of the Data and verifies that the digest matches the RSA signature using the signer's public key Key.

\[
\text{rsa.p u b l i c . e n c r y p t(P l a i n T e x t, P u b l i c K e y, P a d d i n g) -} \rightarrow C h i p e r T e x t
\]

Types:
• PlainText = binary()
• PublicKey = [E, N]
  E, N = Mpint
  Where E is the public exponent and N is public modulus.
• Padding = rsa.pkcs1_padding \| rsa.pkcs1_oaep_padding \| rsa.no_padding
• ChipherText = binary()

Encrypts the PlainText (usually a session key) using the PublicKey and returns the chipher. The Padding decides what padding mode is used, rsa.pkcs1_padding is PKCS #1 v1.5 currently the most used mode and rsa.pkcs1_oaep_padding is EME-OAEP as defined in PKCS #1 v2.0 with SHA-1, MGF1 and an empty encoding parameter. This mode is recommended for all new applications. The size of the Msg must be less than byte.size(N)-11 if rsa.pkcs1_padding is used, byte.size(N)-41 if rsa.pkcs1_oaep_padding is used and byte.size(N) if rsa.no_padding is used. Where byte.size(N) is the size part of an Mpint-1.

\[
\text{rsa.p r i v a t e . d e c r y p t(C h i p e r T e x t, P r i v a t e K e y, P a d d i n g) -} \rightarrow P l a i n T e x t
\]

Types:
• ChipherText = binary()
• PrivateKey = [E, N, D]
  E, N, D = Mpint
  Where E is the public exponent, N is public modulus and D is the private exponent.
• Padding = rsa.pkcs1_padding \| rsa.pkcs1_oaep_padding \| rsa.no_padding
• Plaintext = binary()

Decrypts the ChipherText (usually a session key encrypted with rsa.public_encrypt/3 [page 16]) using the PrivateKey and returns the message. The Padding is the padding mode that was used to encrypt the data, see rsa.public_encrypt/3 [page 16].

\[
\text{rsa.p r i v a t e . e n c r y p t(P l a i n T e x t, P r i v a t e K e y, P a d d i n g) -} \rightarrow C h i p e r T e x t
\]

Types:
• Plaintext = binary()
• PrivateKey = [E, N, D]
  E, N, D = Mpint
  Where E is the public exponent, N is public modulus and D is the private exponent.
• Padding = rsa.pkcs1_padding \| rsa.no_padding
• ChipherText = binary()
Encrypts the PlainText using the PrivateKey and returns the cipher. The Padding decides what padding mode is used, rsa_pkcs1_padding is PKCS #1 v1.5 currently the most used mode. The size of the Msg must be less than byte_size(N)-11 if rsa_pkcs1_padding is used, and byte_size(N) if rsa_no_padding is used. Where byte_size(N) is the size part of an Mpint-1.

rsa_public_decrypt(ChipherText, PublicKey, Padding) -> PlainText

Types:
- ChipherText = binary()
- PublicKey = [E, N]
- E, N = Mpint
  Where E is the public exponent and N is public modulus
- Padding = rsa_pkcs1_padding | rsa_no_padding
- PlainText = binary()

Decrypts the ChipherText (encrypted with rsa_private_encrypt/3 [page 16]) using the PrivateKey and returns the message. The Padding is the padding mode that was used to encrypt the data, see rsa_private_encrypt/3 [page 16].

dss_sign(Data, Key) -> Signature

Types:
- Digest = Mpint
- Key = [P, Q, G, X]
- P, Q, G, X = Mpint
  Where P, Q and G are the dss parameters and X is the private key.
- Mpint = binary()
- Signature = binary()

Calculates the sha digest of the Data and creates a DSS signature with the private key Key of the digest.

dss_verify(Data, Signature, Key) -> Verified

Types:
- Verified = boolean()
- Digest, Signature = Mpint
- Key = [P, Q, G, Y]
- P, Q, G, Y = Mpint
  Where P, Q and G are the dss parameters and Y is the public key.
- Mpint = binary()

Calculates the sha digest of the Data and verifies that the digest matches the DSS signature using the public key Key.

rc4_encrypt(Key, Data) -> Result

Types:
- Key, Data = iolist() | binary()
- Result = binary()
Encrypts the data with RC4 symmetric stream encryption. Since it is symmetric, the same function is used for decryption.

dh_generate_key(DHParams) -> {PublicKey,PrivateKey}
dh_generate_key(PrivateKey, DHParams) -> {PublicKey,PrivateKey}

Types:
- DHParameters = [P, G]
- P, G = M p int
  Where P is the shared prime number and G is the shared generator.
- PublicKey, PrivateKey = M p int()
Generates a Diffie-Hellman PublicKey and PrivateKey (if not given).

dh_compute_key(OthersPublicKey, MyPrivateKey, DHParams) -> SharedSecret

Types:
- DHParameters = [P, G]
- P, G = M p int
  Where P is the shared prime number and G is the shared generator.
- OthersPublicKey, MyPrivateKey = M p int()
- SharedSecret = binary()
Computes the shared secret from the private key and the other party’s public key.

exor(Data1, Data2) -> Result

Types:
- Data1, Data2 = iolist() | binary()
- Result = binary()
Performs bit-wise X O R (exclusive or) on the data supplied.

DES in CBC mode

The Data Encryption Standard (DES) defines an algorithm for encrypting and decrypting an 8 byte quantity using an 8 byte key (actually only 56 bits of the key is used).

When it comes to encrypting and decrypting blocks that are multiples of 8 bytes various modes are defined (NIST SP 800-38A). One of those modes is the Cipher Block Chaining (CBC) mode, where the encryption of an 8 byte segment depend not only of the contents of the segment itself, but also on the result of encrypting the previous segment: the encryption of the previous segment becomes the initializing vector of the encryption of the current segment.

Thus the encryption of every segment depends on the encryption key (which is secret) and the encryption of the previous segment, except the first segment which has to be provided with an initial initializing vector. That vector could be chosen at random, or be a counter of some kind. It does not have to be secret.

The following example is drawn from the old FIPS 81 standard (replaced by NIST SP 800-38A), where both the plain text and the resulting cipher text is settled. The following code fragment returns ‘true’.
Key = <<16#01,16#23,16#45,16#67,16#89,16#ab,16#cd,16#ef>>,
IVec = <<16#12,16#34,16#56,16#78,16#90,16#ab,16#cd,16#ef>>,
P = "Now is the time for all ",
C = crypto:des_cbc_encrypt(Key, IVec, P),
% Which is the same as
P1 = "Now is t", P2 = "he time ", P3 = "for all ",
C1 = crypto:des_cbc_encrypt(Key, IVec, P1),
C2 = crypto:des_cbc_encrypt(Key, C1, P2),
C3 = crypto:des_cbc_encrypt(Key, C2, P3),
C = <<C1/binary, C2/binary, C3/binary>>,
C = <<16#e5,16#c7,16#cd,16#de,16#87,16#2b,16#f2,16#7c,
16#43,16#e9,16#34,16#00,16#8c,16#38,16#9c,16#0f,
16#68,16#37,16#88,16#49,16#9a,16#7c,16#05,16#f6>>,
<<"Now is the time for all ">> ==
crypto:des_cbc_decrypt(Key, IVec, C).

The following is true for the DES CBC mode. For all decompositions \( P_1 \oplus P_2 = P \) of a plain text message \( P \) (where the length of all quantities are multiples of 8 bytes), the encryption \( C \) of \( P \) is equal to \( C_1 \oplus C_2 \), where \( C_1 \) is obtained by encrypting \( P_1 \) with \( Key \) and the initializing vector \( IVec \), and where \( C_2 \) is obtained by encrypting \( P_2 \) with \( Key \) and the initializing vector \( \text{last8}(C_1) \), where \( \text{last}(\text{Binary}) \) denotes the last 8 bytes of the binary \( \text{Binary} \).

Similarly, for all decompositions \( C_1 \oplus C_2 = C \) of a cipher text message \( C \) (where the length of all quantities are multiples of 8 bytes), the decryption \( P \) of \( C \) is equal to \( P_1 \oplus P_2 \), where \( P_1 \) is obtained by decrypting \( C_1 \) with \( Key \) and the initializing vector \( IVec \), and where \( P_2 \) is obtained by decrypting \( C_2 \) with \( Key \) and the initializing vector \( \text{last8}(C_1) \), where \( \text{last8}(\text{Binary}) \) is as above.

For DES3 (which uses three 64 bit keys) the situation is the same.
